Re: WM Ottawa Waste Management Facility, Quarterly report

Dear Mr. Davis:

Please find attached a summary of the quarterly report as per condition 7 of Certificate of Approval (Air) 0741-6S9NPE.

This report is for the period of March 1, 2007 to May 30, 2007.

As per the definition of Facility in the above noted Certificate of Approval (Air) it references under the Reporting section clause 7 for Waste Management to prepare and submit a report on the operations of the Facility. Facility is further defined as the Equipment and Process. The Equipment definition per the C of A (Air) relates to the two (2) enclosed flares and one (1) landfill gas-to-energy facility described in the Company's application. Further, the Process definition per the C of A (Air) relates directly to the soil bioremediation process described in the Company's application. Under the definition outlined the only Equipment and Process that is currently operational is the two (2) enclosed flares. The other equipment and process outlined in the C of A (Air) were appealed by local citizens and as such are not constructed/operational at this time. Based on the above this report will deal with an overview of a number of our activities with the exception of the Landfill Gas to Energy project and the Soil Bioremediation process. We will also provide a listing the environmental complaints received within the last quarter beginning March 1, 2007.

Enclosed Flares

The two (2) enclosed flares were fully operational throughout the reporting period from March 1, 2007 to May 31, 2007. All the records outlined in condition 5 (1), (3), (4) were recorded and are filed electronically in our on-site computer system located in our landfill gas flare building and are available for review by the MOE. As you can appreciate there is a significant amount of data that is recorded on a continuous basis and printing off copies of these reports would require an enormous amount of paper.

Capping

During this reporting quarter a total of 2 Ha were capped on the north and northeast slopes. The slopes were covered with 0.9 m of capping material and compacted to minimize water infiltration and LFG migration.

Cap Inspection

The landfill slopes were inspected on a daily basis and repairs were completed as required.

Landfill Gas Technician

During this reporting quarter a landfill gas technician was hired to inspect and monitor the LFG collection field to maximize its efficiency. This work was previously completed by a consultant. The data collected is entered into a Landfill Gas Management System (LGMS) for analysis by the LFG operations manager.

LFG Well Field Enhancements

The wellheads of the LFG wells were converted to WM wellheads to improve the accuracy of the flow measurements during the quarter.

A total of four LFG well dewatering pumps were installed to improve the LFG collection efficiency in zones where we had watered in wells.

Air Emission Survey

An air emission survey was conducted in May to assess the efficiency of the cap. The cap was repaired and LFG wells were installed in zones where emissions were found. A total of three LFG wells were redrilled in those zones to minimize air emissions.

Summary of Environmental Complaints

A total of 607 odour inquiries were received during the reporting period. The inquiries were analyzed using our on-site weather station to assess each inquiry. We found that 348 (57%) of the inquiries were unsubstantiated, 150 (25%) of the inquiries were possible related to our site and 109 (18%) of the inquiries were potentially related to the site. Based on the number of unsubstantiated inquiries it clearly shows that there were other sources of odour in the community that are not landfill related. A copy of the report is attached.

Yours truly,

A handwritten signature in black ink that reads "Michael Walters".
